Prod. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score listribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   å
                                                                                                                                                                                                                                                                                                                                                                                             S
                                                 This sequence represents a chimeric protein, MGH-mini-profinsulin.
This chimmeric protein contains an N-terminal fraquent of human growth hormone (MGH) of the sequence given in AAV42865, a Heuvable peptide linker (AAV42867), and a human insulin precursor comprising insulin A and B chains (AAV42859). The hGH portion of the chimeric protein acts as an intramolecular chapterone (LMC) for the insulin precursor, enabling it to fold correctly. The cleavable peptide linker has a C-terminal Arg residue which enables the hGH portion of the chimeric protein to be removed after folding has taken place. Production
                                                                                                                                                                                                                                                            the fusion proteins, thus allowing folding or the fused insultn previous at commercially useful high concentrations. The procedural steps of
                                                                                                                                                                  of recombinant human insulin via an hoH proinsulin chimeric protein can provide human insulin with correctly linked cysteine bridges with fewer necessary procedural steps, and hence resulting in a higher yield of human insulin. The IMC sequences not only protect insulin sequences from intracellular decradation by a micrororganism host, but also provide the folding of the fused insulin precision: facilitate the solubility of the fused insulin precision. Additional amounts the fusion protein and decrease the intermedicular interactions among

This sequence represents a chimeric protein, which contains an N-terminal fragment of human growth hormone (NGH) of the sequence given in AAX4886, a cleavable peptide linker (AAX4885), and a human insulin precursor comprising insulin A and B chains (AAX4885). The HoH portion of the chimeric protein acts as an intramplecular chaperone (IMC) for the chimeric protein acts as an intramplecular chaperone (IMC) for the chimeric protein acts as an intramplecular chaperone (IMC) for the chimeric protein at a C-terminal Arg residue which enables the hGH portion of the chimeric protein to be removed after folding has taken place. Production of recombinant human insulin vith correctly linked cysteine bridges with fewer necessary procedural steps, and hence resulting in a higher preduces from intracellular degradation by a microorganism host, but also promote the folding of the fused insulin precursor, facilitate the solubility of the fusion protein and decrease the intermolecular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   interactions among the fusion proteins, thus allowing folding of the fiscal insulin precursor at commercially useful high concentrations. The procedural steps of expanges normide cleavage, oxidative sulphitolysis and related purification steps can thus be eliminated, along with the use of high concentrations of mercaptan or the use of hydrophobic absorbent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (1) TESNKEETQQKSNEELLRISILLIOSMLEPVQLGTGPRFVNQELGGSHLVEALYLVGGBR 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -----LGTGPRFVNQHLCGSHLVEALYLVCGER

with a receaptan to provide 2-10 SH residues per Cys residue, in processed of a charterpic agent and in aq. medium of pH 10-11.

Treating the proof with 3-50 g hydrophobic adsorber resin per 1 aq. creating the proof with 3-50 g hydrophobic adsorber resin per 3 aq. creating the proof with 3-50 g hydrophobic adsorber resin per 3 aq. correctly bonded Cys bridges. Compared with Known methods in the correctly bonded Cys bridges. Compared with Known methods in the correctly bonded Cys bridges. Compared with Known methods in the process is quicker and gives better yields.

Che process is quicker and gives better yields.

Sequences of insulin chain A, B and C are given in AAR68898-97.

Sequences of insulin A, H are given in AAR68898-901.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           51 GTGPRFVNQHLGGSHLVEALYLVGGRRGFFYTPKTRGIVEQCCTSICSLYQLENYCN 107
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    comprises folding a hybrid polypeptide comprising proinsulin under conditions that permit correct disulphide bond formation and subjecting that folded protein to enzymatic cleavage. The insulin produced can then be purified. This sequence is a SOD-insulin B chain-Lys-Arg-insulin A chain hybrid polypeptide and is encoded by the plasmid construct pBAST-R. Transformation of the proper E.coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Recombinant insuling prodot by correctly folding profinsulin hybrid polypeptide - then enzymatic cleavage of folded product, does not require sulphite protection of SH nor use of cyanogen bromide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A new method for the production of recombinant human insulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 304; DB 15; Length 63;

                                                                                                                                                                                                                          A new method for the production of recontingnt human maritim comprises folding a hybrid polypeptide comprising profisuling conditions that permit correct dishulphide bond formation and subjecting that permit correct dishulphide bond formation and produced can them be purified. This sequence is a SCD-insuling produced can them be purified. This sequence is a SCD-insuling produced can them be purified. This sequence is a SCD-insuling the plasmid construct poBASY-LAT. Transformation of the profisuling hybrid polypeptide and is encoded by E.coli host cells with pDBAST-LAT results in the efficient expression of the profisuling hybrid polypeptide, wastell for human insuling production. The method produces recombinant human insuling identical to the natural hommore. Hazardous and cumbersome
                                                                            Recombinant insattin productly correctly folding profiting the board polypeptide - then enzyration disavage of folded predict, does not require sulphite protection of SB not use of eyanosen browide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   procedures involving cyanogen bromide and suiphitolysis to protect SH groups are avoided since the entire hybrid polypoptide folds efficiently to the native structure even with the leader attached
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Prodm. of pro-insulin with correct dissiphide bridges - by treating recombinant precursor protein with mercaptan in alkali and in presence of chaotropic agent, then isolation on

ArgB31 comprises the B and A chains of a claimed buraninsulin derivative. In the final claimed compro. they are covalently connected via disulphide honds between Cys residues AVAR7 and
host cells with pBAST-R results in the efficient expression of the profuscing in fybrid polypeptide, useful for buran insulin production. The method produces recombined than insulin industried to the matural hormone. Hazardous and cumbersome procedures involving ratural hormone. Hazardous and cumbersome procedures involving standard and sulfahitolysis to protect SH groups are avoided since the entire hybrid polypeptide folds efficiently to the native structure even with the loader altached and Tys unprotected.

This method produces pro-insulin and desorbing the pro-insulin. This method produces pro-insulin and correctly bonded Cys bridges. Compared with known methods in the process is quicker and gives better yields.

C cleavage) and overail losses during purification are reduced, i.e. the process is quicker and gives better yields.

C Sequences of insulin chain A, B and C are given in AAR68898-901.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     from human or other insulin. The proinsulin malvenie (produced in recombinant E.coli) is reacted with mercaptan at a ratio of 2.19 SH residues of mercaptan per cys residue of proinsulin. The reaction takes place in the presence of a chaotropic auxiliary agent at pH 10-11 and results in proinsulin with correctly linked cystine.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Promisulin is produced by treating recombinant precursor protein with a mercaptan to provide 2-10 SH residues per Cys residue, in presence of a chactropic agent and in act medium of pH 10-11, treating the produce produce for a chactropic agent and in act medium of pH 4-7, isolating the adsorber resin and promisation and desorbing the pro-insulin. This method produces promisation and desorbing the pro-insulin. This method produces promisation and desorbing the pro-insulin. This method produces promisation and corectly bonded cys bridges. Compared with known methods in involves fewer stades (sep. no sulphitclysis or cyanogen bromide of the process is quicker and gives better yields. Sequences of insulin chain A and C are given in AAR68898-901. (Updated on 25-MAR-2003 to correct PN field.)

which contains an example of a profession molecule correspond to the general formula R2-R1. (B2-B29)-TX-G1y-(A2-A20)-R3 (11). In formula (11), X = Lys. Arg or a peptide of 2-55 amino acids contactive or Arg at the N- and C-reminity T + a natural amino acid; R1 = C Phe or a bond; R2 = H, Arg. Lys. a peptide of 2-45 amino acids Contg. Arg or Lys at the N- and C-terminity R + a natural amino acid; (A2-A20) and (B2-B29) are the insulin A- and B-chain sequence acid; (A2-A20) and (B2-B29) are the insulin A- and B-chain sequence from humar or other Insulin. The profusulin molecule, released by cyanogen bromide, is reacted with mercaptan at a ratio of 2-10 Sin residues of mercaptan per Cys residue of profusulin. The reaction: C takes place in the presence of a chaotropic auxiliary agent at PH 10-11 and results. In precisulin with correctly linked cystine or bridges. Reaction with trypsin and opti. Carboxyperiadase B yields or bridges.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       isolation of inspire that is correctly post-translationally processed - by reacting pro-insulis with a mercaptam in the prosence of a chaotropic agent and purifice, after absorption to hydrophopic

ArgB1N-terminal EEAEAEAR. The insulin precursor comprises the H and A chains of a claimed human insulin derivative preceded by the N-terminal amino acids EEAEAEAR. In the final claimed compsnithey are covalently connected via disulphide honds between Cysresidues A7/B7 and A20/B19. The derivative, which may be present as a zinc ion complex, can be used as a fast action treatment for diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

ArgBl. AraBl N-terminal EBASARABN. The insulin precursor comprises the B and A chains of a chalmed human insulin derivative for co-ned by the N-terminal amino acids REABASHR. In the final claimed roughs they are covalently connected via disulphide bends between Cystresidues A7/B7 and A82/H19. The derivative, which may be present as a zinc ion complex, can be used as a fast action treatment for diabetes.
                                                                                                                                 Human insulin precusor Argil, ArgH31; dinetes; Zine to, conquex; mating factor alpha 1; Neterminal EEAEASAFR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAO86432 encodes AAR71695 matting ractor alpha 1-finsilin precursor
                                                                                                          Mating factor alpha 1-Insplin precursor Argsl, Aras31 N-terminal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Acylated insulin deliv, which may be present as a Zinc ton complex - is used to treat diabetes and is tapla acting.

This sequence represents a human insulin precursor comprising insulin A and B chains. This insulin precursor is a component of the chimeric proteins hold-mini-proinsulin (AAY42860) and the chimeric protein and a cleavable performent of human growth hormone (hGH) and a cleavable peptide linker (AAY42857). The hGH portion of the chimeric protein acts as an intranslecular chaperone (hGM) for the insulin precursor, enabling it to fold correctly. The hGH portion of the chimeric protein acts as an intranslecular chaperone (hGM) for the insulin precursor, enabling it to fold correctly. The cleavable peptide linker has a climeric protein to be removed after folding has taken place. Production of the chimeric protein with correctly linked cysteine bridges with fewer necessary procedural steps, and hence resulting in a higher yield of human insulin with correctly linked cysteine bridges with fewer necessary procedural steps, and hence resulting in a higher yield of human insulin. The IMC sequences not only protect insulin sequences from intraccludar adjusted insulin precursor, facilitate the solubility of the tased insulin precursor, facilitate the solubility of the fusion protein and decrease the intermolecular interactions among the fusion protein, thus allowing folding of the fused insulin precursor at commercially useful high concentrations. The procedural steps of cyandeen bronder bronder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence is joined to the C-terminus of an N-terminal transcut. comprising opt. modified tendamistate. This fusion protein may be converted into human insulin using known methods. The synthetic gene was prepared by the phosphoramidite method. See also AAOQA336. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 25-MAR-2003 to correct PI field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human recontinant insulin may be expressed in Saccharomyces cerevisiae following linkage of the gene to the algorylphosepatidylinositol anchor. This anchoring technique can provide for the release of the product in a highly specific and solective manner. In addition, the recombinant protein will contain an epitope which can be used in its final purinication by immunosifinity. The protein product can be released by e.g. nitrows domination or treatment with neutral detergent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               55 RPVNQHLCGSHLVBALXLVCGBRGFYTPKT-KGTVEQCCTSICSLYQLENYCN 107 | 111.11111 | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 1111. | 111
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Recombinant produ. of proteins, e.g. insulin - by producing the protein with a glycosyliphosphatidylinositol anchor followed by selective releaso.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 5, Application 35/6896334
Patent No. 6221837
CEMEAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Erl. Johann
APPLICANT: Gelsen, Karl
APPLICANT: Seipke, Gernard
TITLE OF INVENTION: Insulin derivatives with increased zinc
TITLE OF INVENTION: Dadding
NUMBER OF SEQUENCES: 18
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  48.9%; Score 262; PR 2; Eventh 65: 91.4%; Pred.
